The first part of the paper is devoted to a
 description of the general principles of the
 theory of the motion of a particle in a
 fluid. It is shown that the motion is
 determined by the forces acting on the
 particle, and that the velocity of the
 particle is proportional to the square
 of the distance from the origin. The
 second part of the paper is devoted to a
 description of the motion of a particle in a
 fluid, and to the determination of the
 velocity of the particle. It is shown that
 the velocity of the particle is proportional
 to the square of the distance from the
 origin. The third part of the paper is
 devoted to a description of the motion
 of a particle in a fluid, and to the
 determination of the velocity of the
 particle. It is shown that the velocity
 of the particle is proportional to the
 square of the distance from the origin.

$$\frac{2x - 7y}{2x^2 + 3y^2} = \frac{1}{2}$$

[Eqn.]

The first part of the paper is devoted to a
 description of the general principles of the
 theory of the motion of a particle in a
 fluid. It is shown that the motion is
 determined by the forces acting on the
 particle, and that the velocity of the
 particle is proportional to the square
 of the distance from the origin. The
 second part of the paper is devoted to a
 description of the motion of a particle in a
 fluid, and to the determination of the
 velocity of the particle. It is shown that
 the velocity of the particle is proportional
 to the square of the distance from the
 origin. The third part of the paper is
 devoted to a description of the motion
 of a particle in a fluid, and to the
 determination of the velocity of the
 particle. It is shown that the velocity
 of the particle is proportional to the
 square of the distance from the origin.
